

MVC - It stands for Model-view-Controller, which is a software design pattern that organizes application code into three parts.

Model - Manages the application data and business logic.

View - Displays the application user interface.

Controller - Handles user input & updates the model & view.

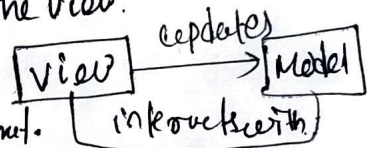

Structure Diagram -

Variants of MVC

1. Model-View-Presenter (MVP)

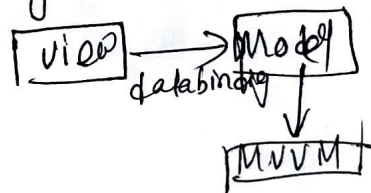

- Presenter replaces Controller.
- User i/p handling is delegated to the presenter by the view.
- Presenter updates model & view.

Best use - Ideal for windows forms & android development.

2. Model-view-ViewModel (MVVM)

- ViewModel: Handles presentation logic & data binding.
- The view binds directly to the ViewModel using data binding.
- Best use - common in WPF, xamarin & angular.

choosing Right Variant.

pattern	Best for	Pros	Cons
MVC	web apps	clean separation	model boilerplate
MVP	web apps	clean Controller logic	Needs binding
